### Zone-Specific Speed Alert System

#### Abstract:

Over-speeding is a leading cause of road accidents in India, contributing to nearly 70% of all crashes and resulting in a staggering 75.2% of fatalities. This alarming trend highlights the urgent need for effective solutions to enhance road safety. One critical issue is the lack of adherence to traffic rules by drivers, which further exacerbates the problem. To address this, a groundbreaking feature called the 'Zone-Specific Speed Alert System' is being introduced in all upcoming vehicles. This innovative system dynamically detects speed limits based on specific zones and provides real-time alerts to drivers. When a vehicle exceeds the permitted speed in a designated area, the system triggers an audible beep, indicating a violation. This alert mechanism aims to promote responsible driving and significantly reduce instances of over-speeding. By encouraging drivers to stay within prescribed speed limits, this system has the potential to bring about a substantial decline in road accidents and fatalities. Through its proactive approach, the Zone-Specific Speed Alert System represents a major step forward in fostering safer roads for everyone.
